LIGHT AUTOMATION USING IR SENSOR

Abstract

This project presents an automatic light control system using an IR sensor to reduce electricity wastage. The sensor detects the presence of a person or object and sends a signal to a relay, which automatically turns the light ON and OFF. This system is simple, efficient, and useful for energy saving in real-life applications

Introduction

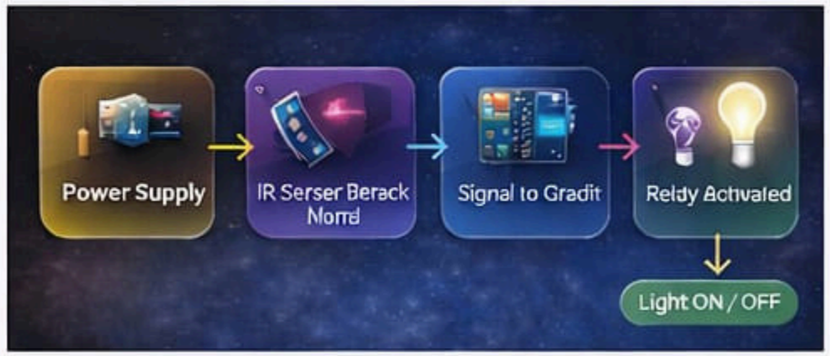
- This project uses an IR sensor to automatically control lights based on movement.
- It helps reduce electricity wastage by turning lights ON and OFF when needed.

Objectives

- To design an automatic light control system.
- To detect human movement using an IR sensor.
- To automatically switch lights ON and OFF.

Graphical Abstract:

Methodology



Conclusion

- The IR sensor based automatic lighting systern helps reduce electricity wastage .
- It provides efficient and automatic light control.
- The project demonstrates the use of sensor technology in energy saving systems.
